Overview of toothed belt and spindle axes

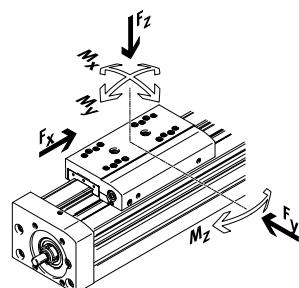

Toothed belt axes

- Velocities of up to 10 m/s
- Acceleration of up to 50 m/s²
- Repetition accuracy of up to ±0.08 mm
- Strokes of up to 8500 mm (longer strokes on request)
- Flexible motor mounting

Spindle axes

- Velocities of up to 2 m/s
- Acceleration of up to 20 m/s²
- Repetition accuracy of up to ±0.003 mm
- Strokes of up to 3000 mm

Guide options

Protected version

- The protected guide cleans the guide rail while the additional wiper seal protects the recirculating ball bearing guide

With central lubrication

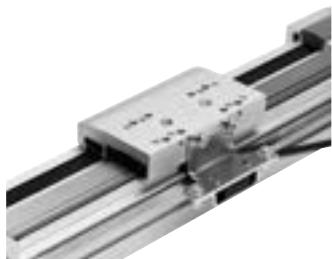

→ Page 25

- The lubrication adapter enables the guide to be permanently lubricated using semi or fully automatic relubrication devices
- The adapters are suitable for oils and greases
- Both lubrication adapters must be connected

Displacement encoder

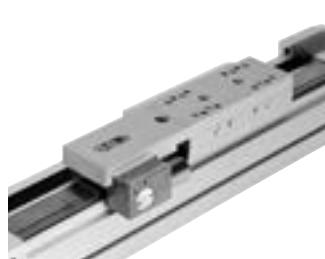

→ Page 14

- The position of the slide can be sensed directly when using the incremental displacement encoder. This means that all elasticities of the drive train can be detected and corrected by the motor controller.

Clamping unit

→ Page 15

- 1- or 2-channel design, for holding loads
- Reliable holding is guaranteed since the forces act directly on the slide
- A limited number of emergency braking operations are permissible with sizes 120 and 185

1) For information about the area of use, see the EC declaration of conformity at: www.festo.com/sp → Certificates.

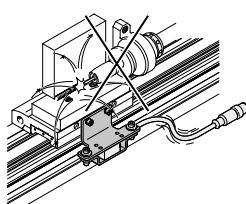

If the devices are subject to usage restrictions in residential, commercial or light-industrial environments, further measures for the reduction of the emitted interference may be necessary.

Note regarding use

- 1) The displacement encoder contains PWIS (paint-wetting impairment substances)
- 2) The spindle axis with displacement encoder is not designed for the following sample applications:

- Magnetic field
- Welding application

Data sheet

Characteristic load values

The indicated forces and torques refer to the slide surface. The point of application of force is the point where the centre of the guide and the longitudinal centre of the slide intersect. These values must not be exceeded during dynamic operation. Special attention must be paid to the deceleration phase.

Max. permissible forces and torques for a service life of 5000 km

Spindle pitch [mm/rev]	10	10	20	25
Ball screw				
Dynamic c _{dyn,KGT} [N]	4000	6800	5700	14100
			12700	25000

Note

For a guide system to have a service life of 5000 km, the load comparison factor must have a value of $f_v \leq 1$, based on the maximum permissible forces and torques for a service life of 5000 km.

If the axis is subjected to two or more of the indicated forces and torques simultaneously, the following equation must be satisfied in addition to the indicated maximum loads:

Calculating the load comparison factor:

$$f_v = \frac{|F_{y1}|}{F_{y2}} + \frac{|F_{z1}|}{F_{z2}} + \frac{|M_{x1}|}{M_{x2}} + \frac{|M_{y1}|}{M_{y2}} + \frac{|M_{z1}|}{M_{z2}} \leq 1$$

F_1/M_1 = dynamic value

F_2/M_2 = maximum value

Data sheet

Service life of the guide

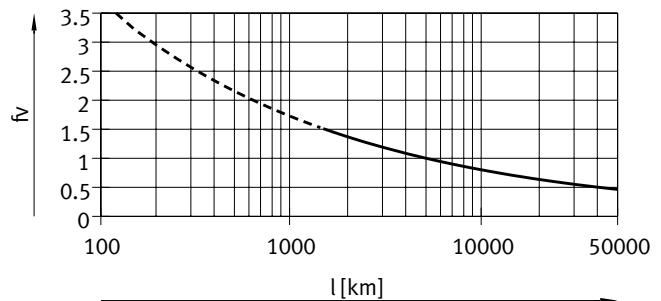

The service life of the guide depends on the load. To be able to make a statement as to the service life of the guide, the graph below plots the load comparison factor f_v against the service life.

Load comparison factor f_v as a function of service life

Example:

A user wants to move an X kg load. Using the formula (→ page 16) gives a value of 1.5 for the load comparison factor f_v . According to the graph, the guide would have a service life of approx. 1500 km. Reducing the acceleration reduces the M_z and M_y values. A load comparison factor f_v of 1 now gives a service life of 5000 km.

These values are only theoretical. You must consult your local Festo contact for a load comparison factor f_v greater than 1.5.

Note

Engineering software
PositioningDrives
www.festo.com

The software can be used to calculate the guide workload for a service life of 5000 km.

$f_v > 1.5$ are only theoretical comparison values for the recirculating ball bearing guide.

Comparison of the characteristic load values for 5000 km with dynamic forces and torques of recirculating ball bearing guides

The characteristic load values of the bearing guides are standardised to ISO and JIS using dynamic and static forces and torques. These forces and torques are based on an expected service life of the guide system of 100 km according to ISO or 50 km according to JIS.

As the characteristic load values are dependent on the service life, the maximum permissible forces and torques for a 5000 km service life cannot be compared with the dynamic forces and torques of bearing guides to ISO/JIS.

To make it easier to compare the guide capacity of linear axes EGC with bearing guides, the table below lists the theoretically permissible forces and torques for a calculated service life of 100 km. This corresponds to the dynamic forces and torques to ISO.

These 100 km values have been calculated mathematically and are only to be used for comparing with dynamic forces and torques to ISO. The drives must not be loaded with these characteristic values as this could damage the axes.

Service life of the spindle

- The service life of the spindle axis depends on the service life of the guide (→ page 17) and of the ball screw.
- The operating coefficient plays a considerable role in determining the possible service life and it can be determined with the help of the table (→ page 19)
- The service life ends when the maximum number of switching cycles or maximum running performance has been reached:
 - 5 million switching cycles or 5000 km running performance

Calculation of the mean feed force F_{xm} with ball screw

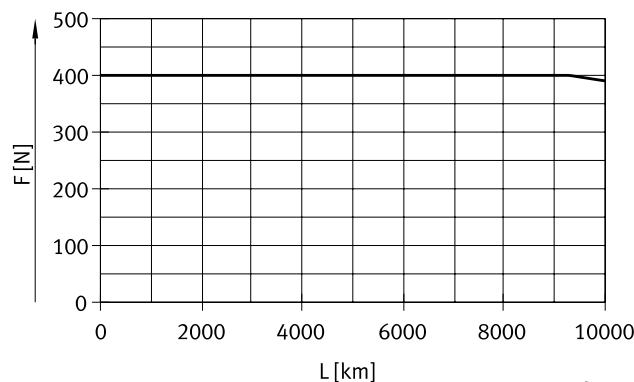

$$F_{xm} = \sqrt{\frac{F_{x1}^3 \cdot s_1 + \dots + F_n^3 \cdot s_n}{s_1 + \dots + s_n}}$$

F_{xm} = Mean feed force

Stroke reserve

Stroke length	Stroke reserve						
The selected stroke corresponds in principle to the required working stroke. The variants GK/GV do not have a wiper seal on the guide. These variants therefore have an additional safety distance between the drive cover and slide that is not designated as part of the working stroke.	If a safety distance (similar to GK/GV) between the drive cover and slide is required for the variants GP/GQ and GK-C/GV-C, this can be defined using the modular product system via the "stroke reserve" feature. With the variants GK/GV, the stroke reserve and safety distance are added for each end position.	• The stroke reserve length can be freely selected	• The sum of the stroke length and 2x stroke reserve must not exceed the maximum working stroke	Example:	EGC-70-500-BS-10P-KF-20H...	Working stroke = 500 mm	2x stroke reserve = 40 mm

Maximum permissible support spacing L (without profile mounting MUE/central support EAHF) as a function of force F

In order to limit deflection in the case of large strokes, the axis may need to be supported.

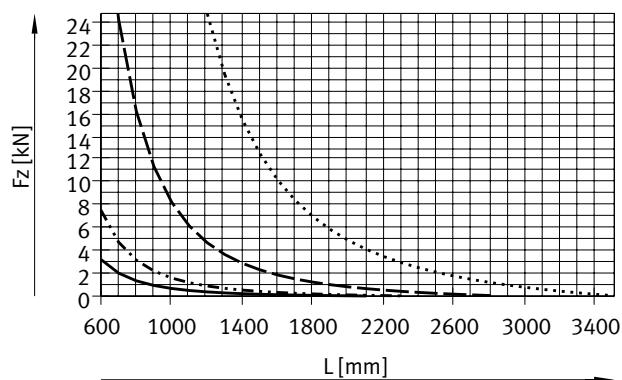

The following graphs can be used to determine the maximum permissible support span l as a function of force F acting on the axis. The deflection is $f = 0.5 \text{ mm}$.

Adherence to the following deflection limits is recommended so as not to impair the functionality of the axes. Greater deformation can result in increased friction, greater wear and reduced service life.

Central lubrication

The lubrication adapter enables the guide of the spindle axis EGC-BS to be permanently lubricated in applications in humid or wet ambient conditions using semi or fully automatic relubrication devices.

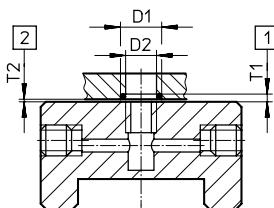

- For size 80, 120, 185
- The modules are suitable for oils and greases.
- The dimensions of the spindle axis EGC-BS are the same with and without central lubrication modules.
- Both lubrication adapters must be connected

- There are three connection options on each side
- Can be used in combination with:
 - Standard slide GK
 - Additional slide KL, KR
- Cannot be used in combination with:
 - Protected recirculating ball bearing guide GP

Structure of a central lubrication system

A central lubrication system requires various additional components. The illustration shows different options (using a hand pump, pneumatic container pump or electric container pump) required as a minimum for designing a central lubrication system. Festo does not sell these additional components; however, they can be obtained from the following companies:

- Lincoln
- Bielomatik
- SKF (Vogel)

Festo recommends these companies because they can supply all the necessary components.

- [2] Pneumatic container pump
- [3] Electric container pump
- [4] Manually operated container pump

Accessories

Note

Depending on the combination of motor and drive, it may not be possible to reach the maximum feed force of the drive.

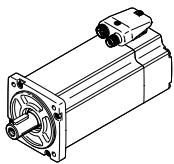

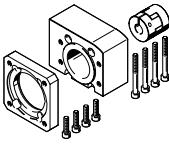

When using parallel kits, the no-load driving torque of the particular kit must be taken into consideration.

Mounting options between axis and support profile

Depending on the adapter kit, the spacing between the axis and the support profile is:
 $x = 20 \text{ mm or } 50 \text{ mm}$

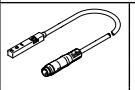

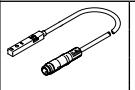

The support profile must be mounted using at least 2 adapter kits. For longer strokes, an adapter kit must be used every 500 mm.
